Chapter 1: INTRODUCTION

1.1 Project Overview

The credit system governed by the banks is one of the most important factors which affect our country's economy and financial condition. Also, credit risk is one of the main functions of the banking community. The prediction of credit defaulters is one of the difficult tasks for any bank. This problem occurs when the banks need to provide loans to the customers who are in need of the money. But by forecasting the loan defaulters, the banks definitely may reduce their loss by reducing their non-profit assets.

1.2 Purpose

People who need loan and want to check whether they are eligible for loan or not

Chapter 2: LITERATURE SURVEY

2.1 References

- [1] Sai Aparna Vangaveeti et al, In this paper, Logistic Regression algorithm had been used for predicting whether the loan is approved or not. They have used various input variables to get the efficient output. The output will be in form of binary (0 or 1). If the output is 0, then there is no approval. If the output is 1 means it is approved
- [2] Kumar Arun et al, This paper's major goal is to forecast whether or not issuing a loan to a specific person will be secure. There are four components in this paper: (i)Data Collection (ii) Comparison of machine learning models on collected data (iii) Training of system on most promising model (iv) Testing. They have used six machine learning methods decision tree, random forest, support vector machine, neural network, adaboost,linear model
- [3] Yamuna B et al, In this paper, they have used five different machine learning model to find the best fitting model. The five different models are linear regression, random forest, support vector machine, decision tree classifier, extreme gradient boost (XG Boost). Among all these machine learning algorithms XGBoost proved to be the best with accuracy 0.82
- [4] Rekha A.G et al, In this paper, to analyze the relationship between financial transactions and loan defaults, two methods based on LSTM (Long Short Term Memory) and a hybrid neural network architecture are proposed. 94% accuracy is attained via bidirectional LSTMs with hybrid architecture. This work's utilization of hybrid neural network architectures offers the right path toward developing an early warning system through online loan default prediction
- [5] Kumar T et al, In this paper, data from former clients of several banks who had loans accepted based on a set of criteria were used. The machine learning model is trained on the record to get reliable results. To forecast loan safety, the logistic regression approach is applied. The data is initially cleaned in order to remove any missing values from the data set. A data set of 1500 examples with 10 numerical and 8 categorical features were used to train the model. When crediting a loan to a customer,a number of factors, including the customer's CIBIL Score (Credit History), business value, and customer assets, have been considered
- [6] Vaidya, This paper, discusses logistic regression and its mathematical representation. In order to implement the predictive and probabilistic approaches to a specific problem of loan approval prediction, his study uses logistic regression as a machine learning technique. This is to decide whether to approve a loan for a set of records belonging to an applicant. It also discusses a few other practical applications for the Machine Learning mode
- [7] Chandan Soni et al, In this paper, a loan prediction system is presented that aids organizations in choosing whether to approve or deny loan requests from clients. The input variables such as loan ID, Marriage, loan amount, gender etc., have been sent to train the model. The prediction is made using the
Decision Tree Algorithm
- [8] Tanvir Anzum et al, In this paper, in order to predict fraudulent loan requests from clients, they have used six machine learning algorithms such as Decision tree, Support vector machine, Random forest, K closest neighbors, Ada-Boost, and Logistic regression. The K-Nearest Neighbors algorithm provided accuracy of 83.75%, which was superior to the other five machine learning techniques
- [9] Jayapandian N et al, In this paper, they have used two different kind of datasets. One is used for training the model and the other dataset is used for testing the model. They used random forest, machine learning algorithm to train the model. The suggested random forest model offers a higher level of accuracy. This approach offers a level of accuracy that is 28% higher than that of conventional prediction
- [10] Suresh Kumar et al, The primary goal of this paper is to decide whether or not the loan offered to a specific individual or organization should be approved. They have used two machine learning algorithms one is random

forest and another one is decision tree classifier. The parameter setting for decision tree are Min Split=20, Max Depth=30, Min Bucket=7. The parameter setting for random forest are Number of trees=450, number of variables=8

2.2 Problem Statement Definition

The credit system governed by the banks is one of the most important factors which affect our country's economy and financial condition. Also, credit risk is one of the main functions of the banking community. The prediction of credit defaulters is one of the difficult tasks for any bank. This problem occurs when the banks need to provide loans to the customers who are in need of the money. But by forecasting the loan defaulters, the banks definitely may reduce their loss by reducing their non-profit assets.

Chapter 3: IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes. It is a useful tool to help teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

3.2 Ideation & Brainstorming

Brainstorm & Idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start skidding concepts even if you're not sitting in the same room.

- 15 minutes to prepare
- 15 minutes to collaborate
- 2-3 people recommended

Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

10 minutes

- Team gathering**
Define who should participate in the session and send an invite. Share relevant information or pre-work ahead.
- Set the goal**
Think about the problem you'll be focusing on solving in the brainstorming session.
- Learn how to use the facilitator tools**
Use the Facilitator Superpowers to run a happy and productive session.

Open invite

Define your problem statement

What problem are you trying to solve? Frame your problem as a how might we statement. This will be the focus of your brainstorm.

5 minutes

Problem

How might we (our problem statement)?

Key rules of brainstorming

To run smooth and productive session

- 1. Stay on topic
- 2. Encourage wild ideas
- 3. Build on others
- 4. Stay positive
- 5. Listen to others
- 6. No criticism
- 7. Generate as many ideas as possible

Share your feedback

3

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

Haritha T

Taking out important details of the customer

Training two or more models to find the effective prediction model

Consider his/her salary as an important feature for loan approval

Checking any fraudulent history of the customer

Dealing with the history of each customer applying for loan

Considering the details of his/her family background for better prediction

Taking bank balance into account

Checking the purpose of the loan, amount of the loan and all ongoing EMIs and existing debt.

Nivaethetha P

Checking monthly balance for your repayment capacity

Keep all the documents ready such as identity proof, address proof, income proof

The applicant should be employed by a public or a private company or self-employed with a minimum turnover

He/she must be between 21 to 60 years of age for loan approval

Should have a good credit score for loan approval

Checking work experience and current employment gauge if your income is steady or not

Salaried applicants must earn a minimum salary every month

Checking the previous loan history of the customer

Jayavarthini P

Ragavi S

3

Group Ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. The cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

10 minutes

Feature Engineering

Impact of Attribute

Taking only the important features such as gender, salary, family background can help in effective prediction

Combining the applicant income and co-applicant income for easier analysis

Salary of a person is directly proportional to the loan approval

History and family background of the person applying for loan

Calculating the savings from the expenditure, EMI for prediction

Graduated people has high chance of approval

Approach

Train the model using different algorithm

Accuracy of each algorithm help us to find the effective model

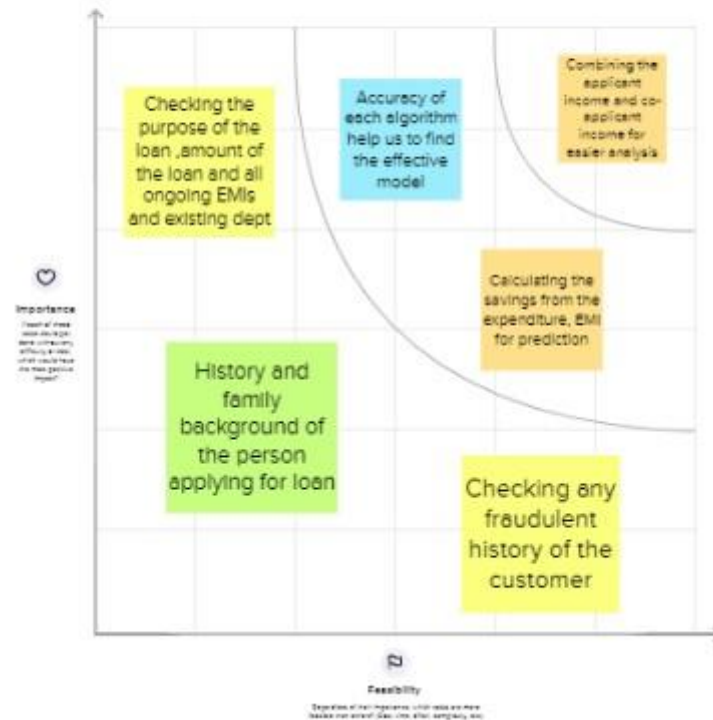

Usage of supervised classification algorithm

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

48 minutes

3.2 Proposed Solution

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	To predict the loan approval for an applicant by considering features such as salary, gender, family background
2.	Idea / Solution description	By taking some important features such as salary, EMI, savings, employment, property area, gender, age and class label (supervised learning), we can apply a classification algorithm such as Random Forest, Decision Tree Classifier and XGBoost on the dataset to train the model. The trained model will help us in better prediction of loan approval

3.	Novelty / Uniqueness	Here we will be comparing the accuracy of all the algorithms to find the efficient model and to give a good customer experience in tracking the status of the loan
4.	Social Impact / Customer Satisfaction	The applicant can easily come to know their loan approval status. Minimal time and Manpower
5.	Business Model (Revenue Model)	The customer has to subscribe to the application if their loan amount is higher than the margin level and also if they are applying for the second time
6.	Scalability of the Solution	The applicant will be able to know about their eligibility for loan approval from home itself and can apply from anywhere. This will save time and reduce manpower for both applicant and the respective bank

3.4 Problem Solution fit

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) Our customers are those who are applying for loan and waiting for the approval of loan CS	6. CUSTOMER CONSTRAINTS Must be an active participant Should not have any remarks Should maintain proper bank balance CC	5. AVAILABLE SOLUTIONS Prediction of loan approval by analysing the user data with previous data stored in order to avoid any fraudulent activities AS	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS Need to predict whether to approve the loan or not to approve the loan for a customer J&P	9. PROBLEM ROOT CAUSE Since there is many fraudulent activities, it is necessary for approving loan for a right person RC	7. BEHAVIOUR Customer spends a lot of time and money for the approval of loan And the verification process also takes time BE	
Focus on J&P, tap into BE, understand RC	3. TRIGGERS Seeing the customers getting their loan approval in a faster manner TR	10. YOUR SOLUTION Our solution is to train a model using algorithms such as random forest, XG boost with the help of previous data available. Through the model trained we can predict the future coming input data of the customer SL	8. CHANNELS of BEHAVIOUR 8.1 ONLINE Customers can easily upload their details with the help of internet and easy verification of their uploaded documents CH	Identify strong TR & EM
	4. EMOTIONS: BEFORE / AFTER Before: Process take too much of time and money After: Less amount of time for the approval of loan and saves money and energy for the customer. And helps to identify the fraudulent activities in the bank perspective EM		8.2 OFFLINE Customer need to visit the bank for each and every process, which is time consuming way	

Chapter 4: REQUIREMENT ANALYSIS

4.1 Functional requirement

FR No.	Functional Requirement	Sub Requirement (Story / Sub-Task)
FR-1	User Requirement	To check the loan eligibility using the credit score, prediction for loan approval
FR-2	User Confirmation	Through one time verification and using captcha etc.,,
FR-3	Profile Updation	The user can update their profile when there is need to add any add-ons to it
FR-4	User Registration	The user gets login/signup using Gmail account or by using mobile number

FR-5	User Authentication	The OTP/verification code the user gets authenticated and OTP is used for mobile number registration
FR-6	Feedback Evaluation	The user provided feedbacks are used for evaluation of app performance and Updation is made over that

4.2 Non-functional Requirements:

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	This application is mainly used to analyse cibil score and predict the eligibility for users to avail for loan approval by following community guidelines
NFR-2	Security	It uses OTP and verify code verification for each user and uses and hybrid security features over internet to safely maintain the updated documents of user
NFR-3	Reliability	Maintaining the app up to date for reliant future, durability and efficiency of the mobile app by releasing patch fix and software updates
NFR-4	Performance	It has a user-friendly interface and can check multiple persons cibil score parallels irrespective of server traffic. It stores the data collected over in an efficient database
NFR-5	Availability	It is platform independent and it is available where the users are able to wish it want to be. Depending upon the user requirements all services get offered
NFR-6	Scalability	Provides accurate prediction for user eligibility by using highly efficient algorithms and testing all the documents uploaded by the user at highly efficient rate

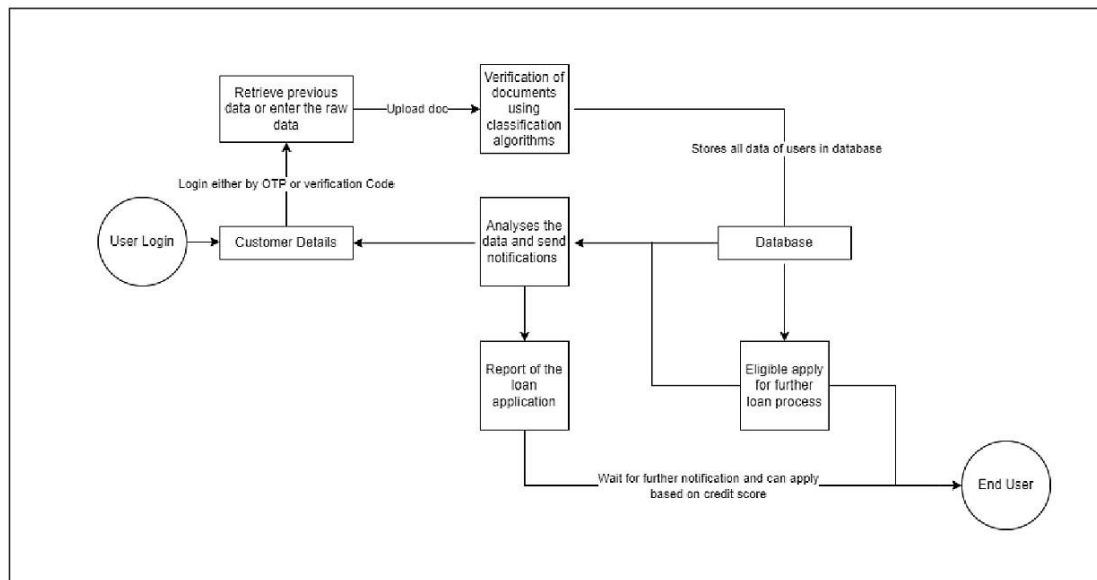

Chapter 5: PROJECT DESIGN

5.1 Data Flow Diagrams

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

DFD Level 0:

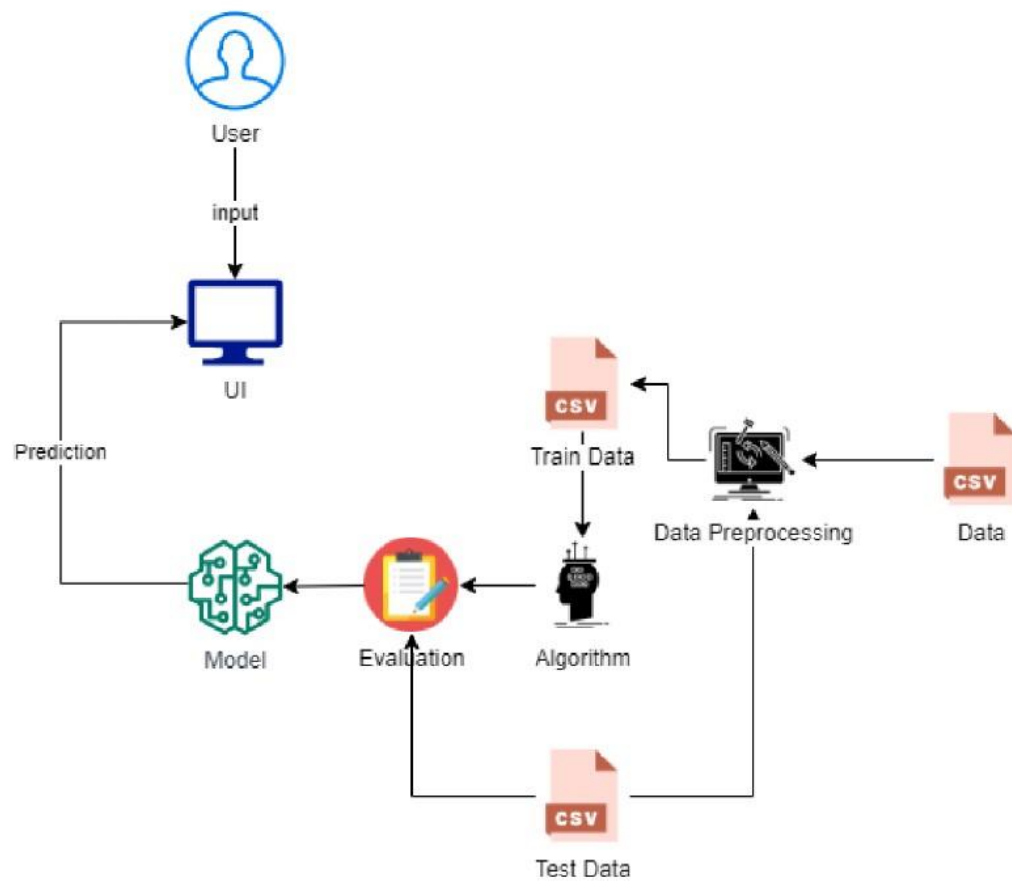

5.2 Solution & Technical Architecture

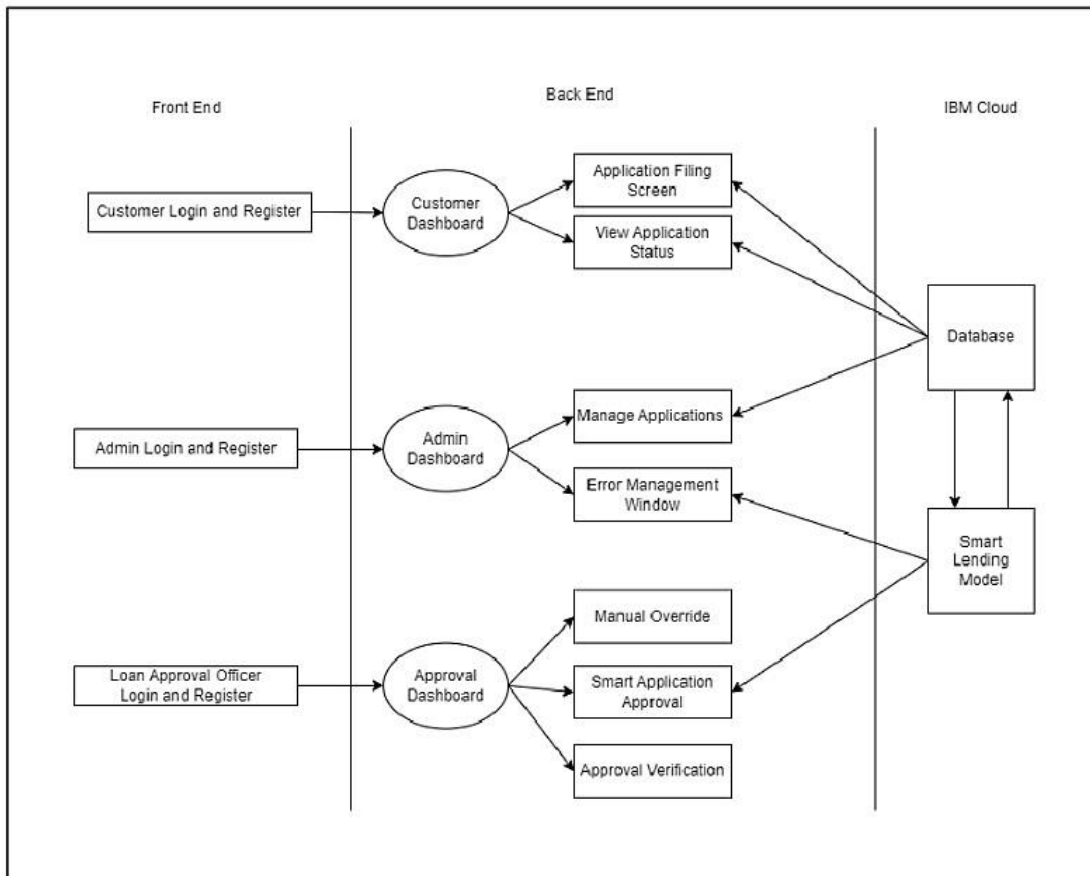

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems
 - Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders
 - Define features, development phases, and solution requirements
 - Provide specifications according to which the solution is defined, managed, and delivered.
- Solution Architecture

Technical Architecture

5.3 User Stories

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	As a user I can enter Gmail and set a password	High	Sprint-1
		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can get a code for confirmation	High	Sprint-1
		USN-3	Registration as a user can be confirmed using OTP or verification code	Aa a user can get OTP or verification code	Low	Sprint-1
	Login	USN-4	Users can login to web/mobile interface by storing or using the registered login credentials	Able to login	Medium	Sprint-1
		USN-5	As a user, I can log into the application by entering email & password	Can be able to login using Gmail	Medium	Sprint-1
	Dashboard	USN-6	As a user, I should be able to login the profile or status dashboard	Able to access dashboard account	Medium	Sprint-2
Customer (Web user)		USN-7	Checks the user feedback and provide essential technical support	Access the account/able to access the dashboard		Sprint-2
Loan Approval Executive	Automated analysis of score	USN-8	As a loan approval officer, I can make decisions by checking and monitoring all the feeded applications and getting to a prediction	Get a decision for loan prediction based on the details provided in the loan application	High	Sprint-3
		USN-9	As a admin cibil score which represents credit history plays major role in analysis	Cibil score/credit history place major role	High	Sprint-3
Admin	Login/Register	USN-10	As an admin I should be able to login with the unique email and password	Able to logged in	High	Sprint-4
	Dashboard	USN-11	As an admin I need the access of full authority towards the dashboard	Access the dashboard	Medium	Sprint-4

Chapter 6:PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation

Product Backlog, Sprint Schedule, and Estimation

Sprint	Functional Requirement (Epic)	User Story Number	User Story/Task	Story Points	Priority	Team Members
Sprint-1	Dataset	USN-4	Download the dataset	1	High	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-1		USN-5	Visualize the dataset	2	Low	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-1		USN-6	Pre-Process the dataset	3	Medium	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-1	Machine Learning Model	USN-7	KNN Model Building	5	High	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-2		USN-8	Decision Tree Model Building	5	High	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-2		USN-9	Naïve Bayes Model Building	5	High	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-2		USN-10	Fine Tuning of the Model	3	Low	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-2		USN-11	Evaluation and saving of the model	5	High	Haritha Jayavarthini Nivaethetha Ragavi

Sprint-3	Customer Interface	User	USN-12	Model Integration with flask	5	High	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-3			USN-1	As a user,I should be able to access the dashboard	3	Medium	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-3			USN-2	Selecting the loan type	3	Low	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-3			USN-3	Fill the application and check the eligibility for loan approval	5	High	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-4	Deployed website	the	USN-13	Register on IBM Cloud	3	Low	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-4			USN-14	Train the ML Model on IBM Cloud	5	Medium	Haritha Jayavarthini Nivaethetha Ragavi
Sprint-4			USN-15	Deploy the website on IBM Cloud	5	High	Haritha Jayavarthini Nivaethetha Ragavi

6.2 Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned Date)	Sprint Release Date (Actual)
Sprint-1	11	6 Days	24 Oct 2022	30 Oct 2022	11	30 Oct 2022
Sprint-2	18	6 Days	01 Nov 2022	07 Nov 2022	18	07 Nov 2022

Sprint-3	16	6 Days	04 Nov 2022	10 Nov 2022	16	10 Nov 2022
Sprint-4	16	6 Days	12 Nov 2022	18 Nov 2022	16	18 Nov 2022

Velocity:

Imagine we have a 10-day sprint duration, and the velocity of the team is 20(points per sprint). Let's calculate the team's average velocity(AV)per iteration unit(story points per day)

$$AV = \frac{\text{sprint duration}}{\text{velocity}} = \frac{20}{10} = 2$$

Our Project velocity

Sprint-1 = $11/6 = 1.833$

Sprint-2 = $18/6 = 3$

Sprint-3 = $16/6 = 2.67$

Sprint-4 = $61/24 = 2.54$

Burndown Chart

A burndown chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies such as Scrum. However, burndown charts can be applied to any project containing measurable progress over time.

Burndown Chart

tc03		Functional	Home page	Field address validation		1. Double-click on the E-mail address field		User should navigate to E-mail address field	Working as expected	Pass				
tc04		Functional	Output page	Loan Credibility predicted output		1. Click on eligibility check button 2. View the predicted results		User should access the Loan credibility predicted result	Working as expected	Pass				

8.2 User Acceptance Testing

1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the [ProductName] project at the time of the release to User Acceptance Testing (UAT).

2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	9	3	1	2	15
Duplicate	0	0	4	0	4
External	1	2	0	0	3
Fixed	10	5	4	21	40
Not Reproduced	0	0	0	0	0
Skipped	0	0	0	0	0
Won't Fix	0	0	0	0	0
Totals	20	9	9	23	64

Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

Outsource Shipping	3	0	0	3
Exception Reporting	7	0	0	7

Final Report Output	4	0	0	4
Version Control	2	0	0	2

Chapter 9: RESULTS

9.1 Performance Metrics

Model Performance Testing:

Project team shall fill the following information in the model performance testing template.

S.No.	Parameter	Screenshot / Values
1.	Data Responsiveness	The ML model takes about 0.3 seconds to process the dataset. The credibility result is predicted in approximately 0.9 seconds
2.	Utilization of Data Filters	Sufficient data filters have been used for ideal model building
3.	Effective User Story	No of Scene Added - 15
4.	Descriptive Reports	No of Visualizations / Graphs - 13

Chapter 10: ADVANTAGES & DISADVANTAGES

Advantages:

Keep Control of the Company

A bank loans money to a business based on the value of the business and its perceived ability to service the loan by making payments on time and in full. Unlike with equity finance where the business issues shares, banks do not take any ownership position in businesses. Bank personnel also do not get involved in any aspect of running a business to which a bank grants a loan. This means you get to retain full management and control of your business with no external interference.

Bank Loan is Temporary

Once a business borrower has paid off a loan, there is no more obligation to or involvement with the bank lender unless the borrower wishes to take out a subsequent loan. Compare this with equity finance, where the company may be paying out dividends to shareholders for as long as the business exists.

Interest is Tax Deductible

The interest on business bank loans is tax-deductible. In addition, especially with fixed-rate loans, in which the interest rate does not change during the course of a loan, loan servicing payments remain the same throughout the life of the loan. This makes it easy for businesses to budget and plan for monthly loan payments. Even if the loan is an adjustable-rate loan, business owners can use a simple spreadsheet to compute future payments in the event of a change in rates.

Disadvantages:

Tough to Qualify

One of the greatest disadvantages to bank loans is that they are very difficult to obtain unless a small business has a substantial track record or valuable collateral such as real estate. Banks are careful to lend only to businesses that can clearly repay their loans, and they also make sure that they are able to cover losses in the event of default. Business borrowers can be required to provide personal guarantees, which means the

borrower's personal assets can be seized in the event the business fails and is unable to repay all or part of a loan.

High Interest Rates

Interest rates for small-business loans from banks can be quite high, and the amount of bank funding for which a business qualifies is often not sufficient to completely meet its needs. The high interest rate for the funding a business does receive often stunts its expansion, because the business needs to not only service the loan but also deal with additional funding to cover funds not provided by the bank. Loans guaranteed by the U.S. Small Business Administration offer better terms than other loans, but the requirements to qualify for these subsidized bank loans are very strict

Chapter 11:

CONCLUSION

The analysis starts from data cleaning and processing missing value, exploratory analysis and finally model building and evaluation of the model. The best accuracy on public test set is when we get higher accuracy score and other performance metrics which will be found out. This project can help to predict the approval of bank loan or not for a candidate.

Chapter 12:

FUTURE SCOPE

In order to analyse the risk associated for the bank, credit evaluation largely involves gathering information about the customer and examining the project's technical, financial, and economic viability and this process developed a lot
